**Re: *Comment Letter Supporting the International Energy Conservation Code Appeals Filed by the American Public Gas Association***

ICC Appeals Board:

On January 2, 2023, the American Public Gas Association (APGA) filed an appeal of several proposed provisions of the 2024 International Energy Conservation Code (IECC). We are writing to you today in support of these appeals.

Our organization supports the transparent development of building codes and standards, including the IECC, through consensus-based processes that follow the tenants of due process and fair competition. Unfortunately, we are concerned that a number of provisions were inappropriately processed for inclusion in the 2024 version of the code and thus must be removed.

As noted in APGA's appeal filing, a number of the proposed provisions fall squarely outside of the IECC's clear scope and intent provisions. Provisions that incorporate additional energy efficiency and greenhouse gas reductions belong squarely in the nonmandatory appendices, if in the code at all, as they neither guarantee increased energy efficiency nor emissions reductions, but do increase the cost of complying with the ever-increasingly complex code.

ICC codes are adopted at all levels of government, so it is important to ensure that ICC's robust development process for the IECC remains fair and transparent. We were disappointed to see that the development of the 2024 IECC did not always meet this high standard that ICC has traditionally held itself to. These violations in due process have resulted many provisions that would hinder the ability for Americans to choose the direct use of natural gas for their homes or businesses, making the code anticompetitive on its face.

The Gas Authority, officially known as the Municipal Gas Authority of Georgia, represents 83 municipally owned natural gas distribution systems across five states (68 in Georgia, 10 in Alabama, 3 in Florida, 1 in Pennsylvania, and 1 in Tennessee). These sy

Mandating "EV" ready homes or setting unreasonable efficiency targets may compel typical municipal customers to make difficult choices between heating or cooking and meeting other life essential expenses. The Gas Authority actively collaborates with communities such as Sparta, Georgia, where the average annual family income falls below \$40,000. The residents in these areas heavily depend on natural gas as an affordable fuel for home heating and cooking. In Georgia, the escalating electricity rates pose an additional strain on consumers. The challenges and costs of converting existing homes or constructing new ones with an all-electric setup will make affordable housing unattainable for most of these consumers.

One crucial service provided by the Gas Authority to municipal systems is an aggregated risk management (hedging) program. This program is strategically designed to mitigate price risks and curb volatility in retail rates for consumers. Over time, these initiatives have consistently prevented major price spikes, keeping retail natural gas rates reasonable and well below those of electricity.
